CROCKETT COURIER: JUNE 23, 1949

TEXAS POWER AND LIGHT COMPANY NAMES OFFICERS

John W. Carpenter was named chairman of the board, W. W. Lynch, president, and J. M. G. Collier, vice president and assistant general manager of the Texas Power and Light Company at a meeting of the directors of the company following the annual meeting of stockholders at the Houston building, Dallas, Texas, Wednesday, June 15, 1949. Mr. Carpenter is now completing his thirtieth year as general manager and his twenty-second year as president and general manager of the company. Mr. Lynch has been in the service

W. W. Lynch.

of the company for 20 years, has been vice president since 1926, executive vice president since 1937 and director since 1938. He is a native Texan, born in Marshall. Following his graduation from Texas A. & M. College in 1922, he spent a year as a student engineer with Westinghouse Electric Manufacturing Company at East Pittsburgh, Pa., first as sales representative and later as service engineer. In New York city, in November, 1923, he entered the employ of Texas Power and Light Company, where he served successively as assistant to the efficiency engineer, construction supervisor, assistant to the superintendent of transmission and head of the distribution department, which position he held until he was moved to the executive department in 1936 and elected vice president.

Mr. Collier, a native Texan, born in Jasper, was graduated from Texas A. & M. College in 1926, after which he entered the employ of the engineering department of Texas Power and Light Company. He has been with the Texas Power and Light Company during the entire time, in various capacities, except for a few years when he was on successive leaves of absence on engineering and executive work in connection with electric utility operations in Texas and elsewhere. Reporting to the stockholders, Mr. Carpenter told about the progress made during the last year, stating that the company now serves more than 200,000 customers. He reported that, during 1948, the company enlarged its Brownwood power plant by the installation of two 2500 Kilowatt generators, built a new generating station at Clarksville of 1900-Kilowatt capacity, enlarged many of its substations and made a vast number of extensions and improvements to the transmission and distribution facilities. He stated that installation of a new 125,000-Kilowatt turbo-generator at the Waco plant has been completed this year and that the new 50,000-Kilowatt generator at the Trinidad generating station would be ready for service late in the year. The stockholders voted to amend

INSECT CONTROL WITH CHLORDANE

The newest and most effective insecticide against cock roaches—"water bugs"—and certain kinds of ants is chlordane, which has proved a more powerful killer of these particular pests than DDT. In the research being conducted by entomologists of the U. S. Department of Agriculture, chlordane shows promise also against cigarette beetles, clothes moths and some other household insects, but further testing is needed before recommendations are made.

Two-per cent chlordane sprays, with oil or water base, now are for sale in many department, drug and hardware stores under various trade names. When buying, shoppers should note whether 2 per cent chlordane is among the ingredients listed on the container. Oil-base sprays are transparent and often slightly straw-colored; water-base sprays look milky white. Both evaporate after spraying, leaving a invisible, odorless film on surfaces to kill pests coming in contact with it. The killing power of chlordane lasts weeks or even months. Chlordane should not be used for aerial spraying of crops, as DDT may be used, but should be directed only on places where the insects crawl, hide or enter the house. If preferred, it may be applied with a paint brush. In general, use the same precautions as when spraying with DDT or other insecticides. Remove foods and utensils in the kitchen before spraying; cupboards and replace them only after the spray dries. Wash hands after using. Any oil spray may irritate skin, nostrils or throat so care should be taken to have the room well-ventilated and to aim the spray carefully. Against roaches, it is important to spray their hiding places—cracks, crevices, under doors and windows, under floors, behind or underneath furniture.

Against ants, spray cracks or openings where they enter the house; also baseboards, window sills or other surfaces where they crawl. Spraying the nest gives faster results but may be in the wall or other place difficult to locate. Ants sometimes come into the house from nests under porches, near house foundations, or at hills outside.

OLD TIMERS CONGREGATE

Noelus Prairie, June 15.—First homecoming of the Noelus Prairie "Crawdaddies", old-time settlers of this place and their descendants, was held here. It was voted unanimously to make the affair an annual event. To carry out the plan, an organization was formed with the following officers elected: M. M. Holliman, president; C. W. Dennen, of Yocum, vice president; Clayton Davis of Groveton, secretary; and Lorraine Ainsworth of Houston and Basar Mac Kev, reporters. LeRoy Faver of Crockett, Mrs. Mann English and W. L. Gibson, both of Groveton, were named as the Waco plant has been completed this year and that the new 50,000-Kilowatt generator at the Trinidad generating station would be ready for service late in the year. The stockholders voted to amend

SIMPLE MAKE-UP IS KEY TO IMPROVE NEWSPAPER

"More attention is now being given by a steadily increasing number of both daily and weekly publishers, to the appearance and readability of their newspapers in order to more effectively meet present-day competition from other media," Wesley F. Carter, editor of The Linotype News and director of public relations for Mergenthaler Linotype Company, told members of the Panhandle Press Association in session April 8 and 9 at Amarillo.

"Newspapers placing emphasis on better styling and improved readability are realizing profitable results," Carter said. "The appearance of the newspaper is a key to its success, as well as circulation, is directly affected by the appearance of the product the publisher is selling. The present trend is decidedly toward larger body faces, more simplified and uniform type settings and improved makeup."

The chief fundamental in designing a more readable newspaper is simplicity. The number of type faces in a headline schedule should be held to one good family, or at the most, to only two (and these two should blend well together). A large number of different sizes is not necessary. Five or six properly selected sizes provide ample variety for display and attractiveness. It has taken us a long time to learn the value of white space in newspaper page makeup. The advertising designer learned it long ago. Elimination of extra decorative material, multiple decks of headlines and other complications, our pages are now easier to make up and easier to read.

How deep is an oil well? . . .
How long is a piece of string!

The oil industry is going deeper to find more oil for your needs, to discover increasing needs for oil that will be available for long-range increasing needs for national emergencies. Fifteen years ago, the average depth of a Humble well was 4,362 feet. Ten years ago, the Company went 700 feet deeper, to about 5,000 feet, to find oil for you. And the average depth of producing Humble wells drilled in 1948 was 6,699 feet. That's average. The oil companies go a lot deeper if they think they can find oil farther down. The deepest well drilled in 1948 was 17,696 feet; it was a wildcat well which discovered neither oil nor gas. How deep is an oil well? It's as deep as it has to be to find or produce oil, or to prove that there's no oil there. Costs go up as wells go deeper. A well 10,000 feet deep costs, on the average, about three times as much as a 7,000-foot well, a 15,000-foot well may cost 12 times as much. To find and produce more oil for you requires a tremendous lot of money. And in any territory, there's a considerable risk involved, for only by drilling can you prove, or disprove, that a geological or geophysical "prospect" actually contains oil. In fact, a good many hundreds of millions of dollars have been invested in drilling "dry holes." In an unproved area, the odds are 9 to 1 against the chances of finding oil. But the oil industry continues to drill wherever scientists think there is a possibility of finding oil; it will go as deep as today's equipment will permit in its hunt for oil . . . because it is a responsible, dynamic industry whose major interest is to supply the oil you need today, and to provide reserves of oil for your needs, and those of the country, in the years to come.

"Gas consumption is as much as 25% lower in our 145-h.p. Ford BIG JOB!"

OUR FORD 7-7 BIG JOB is loaded daily to the max. It's a 7,000-gallon Gross Weight allowable and travels 7,100 to 8,000 miles annually. This mileage is attained with an average maintenance cost of \$35.00. Gas consumption is consistently lower, as much as 25% compared to competitive makes of the same size.

Mr. Walker is but one of many Ford BIG JOB enthusiasts who have taken the time to write about the remarkable performance of the Ford 7-7 and 8-8. Thousands of others are profiting from gas economy unusual in the big truck field . . . from an ability to carry gross loads of 30,000 lbs. and more on tandem-axle units . . . from power that makes the BIG JOB the king of the hills. Come in and get the facts on any one of over 139 Ford Bonus Trucks. Truck models for '49, built extra strong to last longer.

Brand New 145-Horsepower Ford V-8 Truck Engines

New Super Quadrex Single-Speed Axles: 2-Speed optional on F-8

Big Trax: up to 10,000-20 on F-8, up to 9,000-20 on F-7

New Heavy Duty Five-Speed Transmissions

Big Rear Brakes, Power Actuated, 16-in. by 5-in. on F-8

Built and Warranted for the following ratings:

'49 FORD 7-7 19,000 lbs. 35,000 lbs.

'49 FORD 8-8 21,500 lbs. 39,000 lbs.
